Conflict of Interest Statement

- Speaker honoraria: Astra Zeneca, Bayer, Biotronik, Boehringer Ingelheim, Daiichi-Sankyo, Pfizer
- Grants (through institution): Bayer, Amgen, Chiesi, Astra Zeneca

P.L. Female, caucasian 79 yo

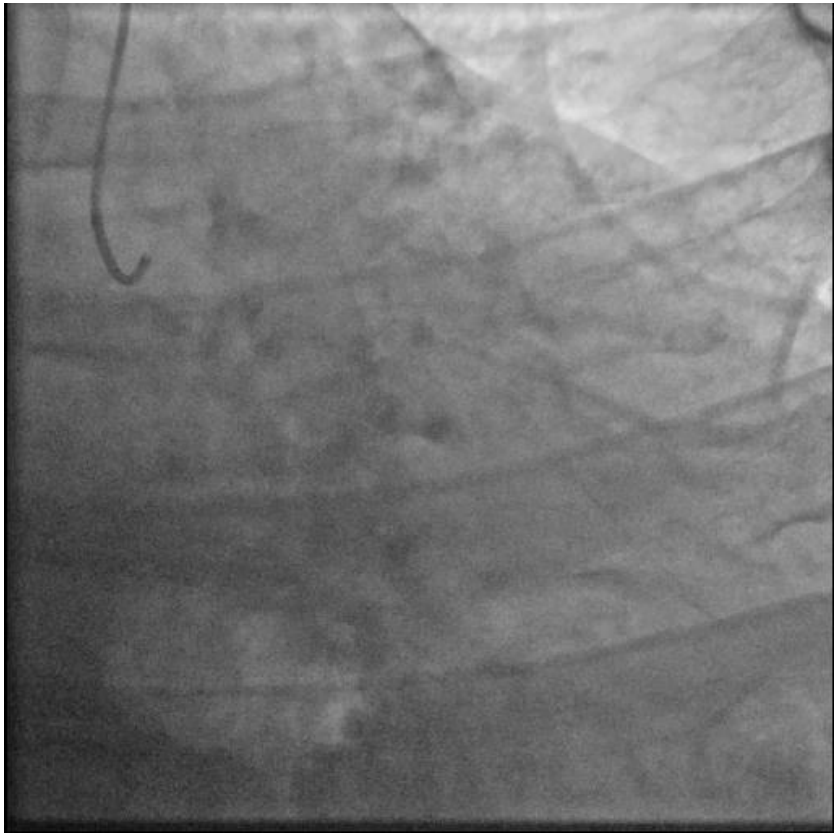
BMI: 24 kg/m2 **eGFR (MDRD):** 53 ml/min/1,73m2
CV risk factors: arterial hypertension, dyslipidemia

Comorbidities: COPD (moderate obstruction), mild IRC, previous surgery for colon cancer, TIA in the past (50% left carotid stenosis), severe osteoporosis

- **June 2017:** worsening dyspnea (NYHA III) -> **Echo:** EF = 28%, LV dilatation and mild-to-moderate MR
- **Coronary angiography:** Complex, severe 3VD

Syntax Score I 40

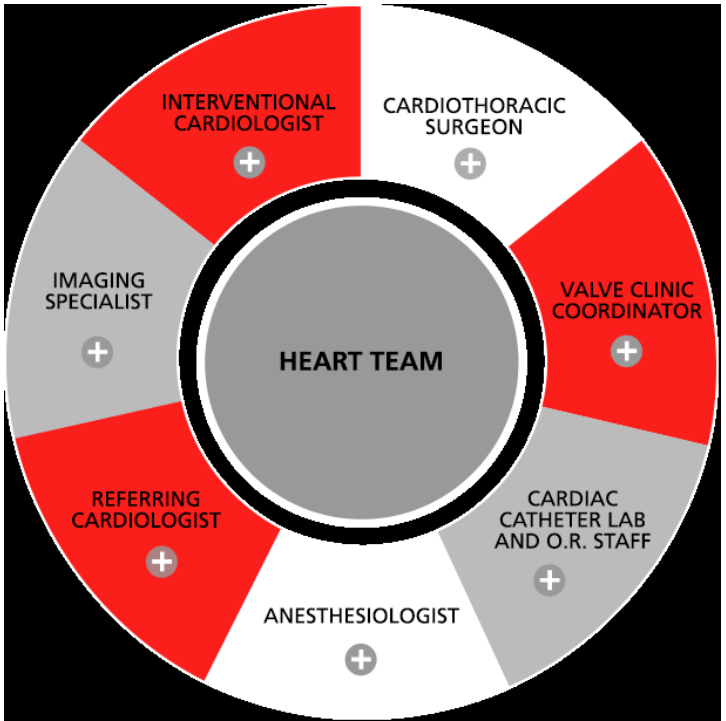
P.L. Female, caucasian 79 yo



P.L. Female, caucasian 79 yo

October 2017: Heart Team discussion

not eligible neither for percutaneous nor surgical revascularization, CRT not indicated → medical therapy



P.L. Female, caucasian 79 yo

CARDIOLOGICAL HISTORY:

- **New hospitalization for NYHA III HFrEF (January 2018)**

- **Echo:** EDD 65 mm, EF 22%. E/E' 24. Moderate MR (Carpentier IIIB). PAPs 45 mmHg
  → **ICD Implantation (primary prevention), medical therapy optimized**

- After discharge @ ICD check **Atrial Fibrillation** → Apixaban 5 mg bid (added to aspirin).

- **March 2018**: further hospitalization for worsening dyspnea → **Echo:** EF 22%. E/E' 32. Moderate MR (Carpentier IIIB). TAPSE 16 mm. RVFAC 35%. PAPs 40 mmHg.

P.L. Female, caucasian 79 yo

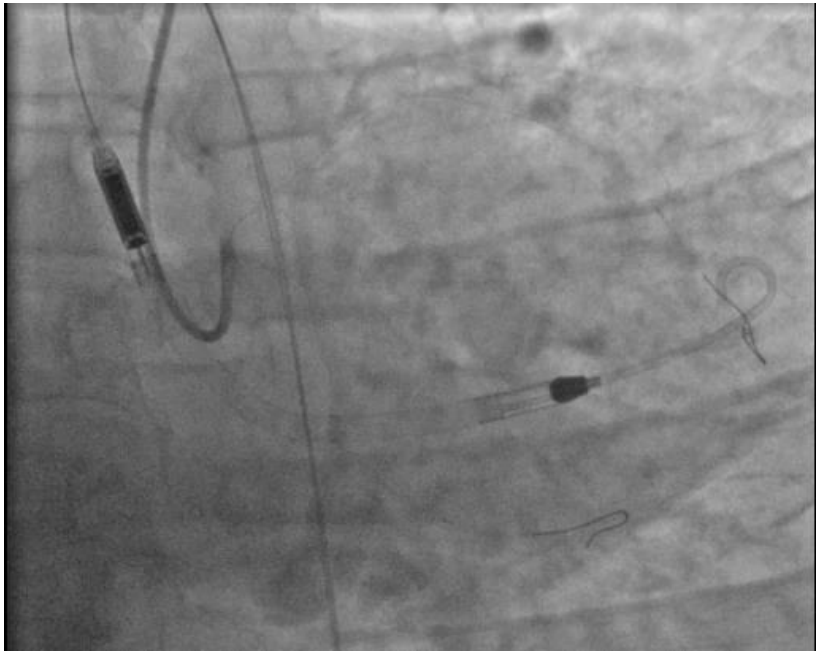
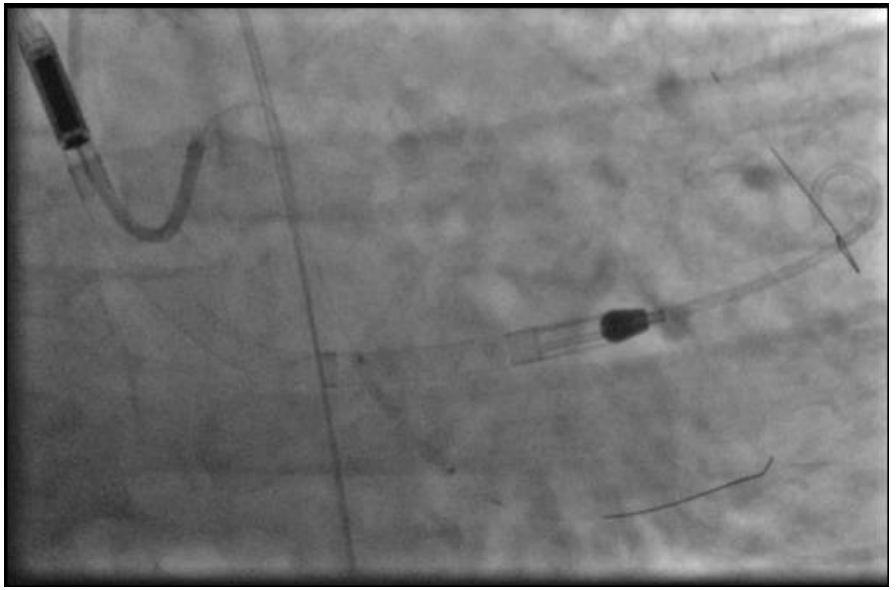
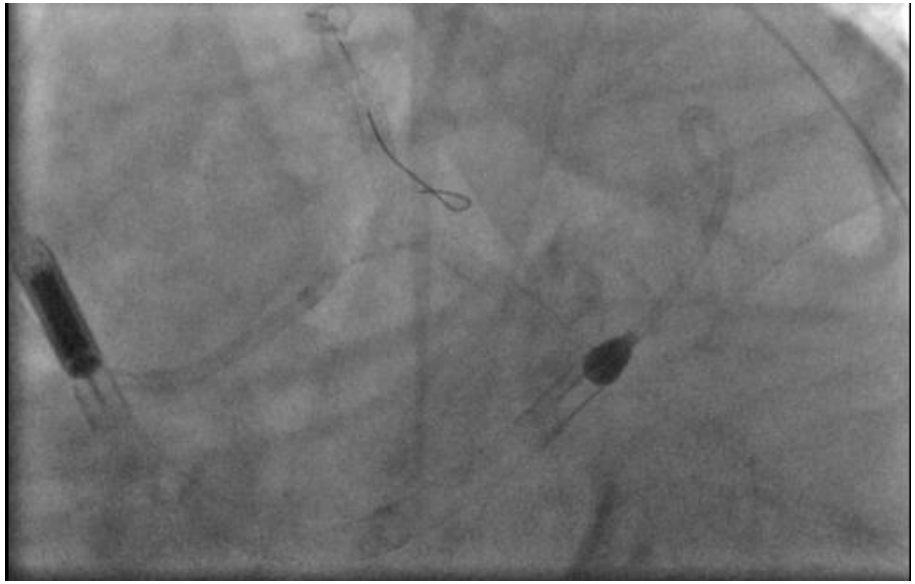
- Microaxial flow pump (Impella CP) up to 3.8 L/min support

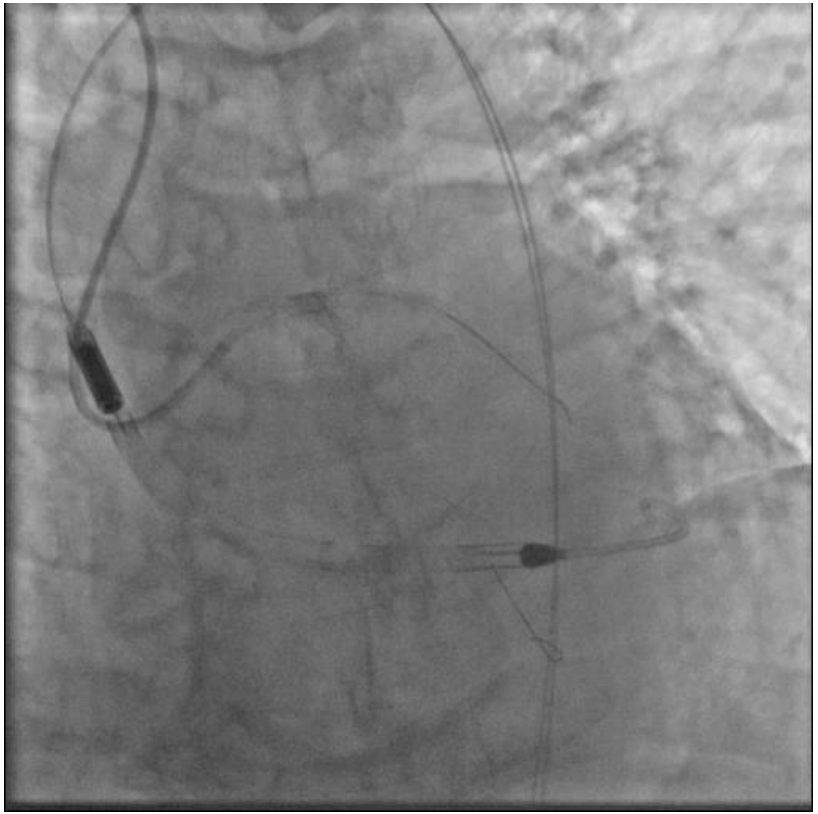




P.L. Female, caucasian 79 yo

- **End procedure, impella kept in for further CCU support**





P.L. Female, caucasian 79 yo

- In CCU→ **depression of cardiac function requiring inotropic support** (Norepinephrine 1,2 ml/h + Levosimendan 1,7 ml/h).

- **11/04: after 48 hours of LV support, UFH stopped and angio-assisted removal of IMPELLA with evidence of stent patency and TIMI flow 3.**

- **12/4:** On IMPELLA removal→ AF + 2 ICD shock on VT (→ Amiodarone) + severe cardio-circulatory depression requiring again inotropic support (Norepinephrine 2 ml / h + Dobutamine up to 4.2 ml/h). **On UFH&DAPT (clopidogrel-ASA)**

- **17/4**: **Speech disturbance → Head CT**: In the left temporo-fronto-parietal areas minimal subarachnoid blood level along the furrows. Hemoventricle in bilateral sites in the occipital horns.
  → **UFH withdrawn**; DAPT maintained after Neurosurgical consultation
  → **Rate control** to minimize cardio-embolic risk.
  After clinical stabilization→ logopedic and neuromotor rehabilitation

Discharged home after 20-day rehabilitation period

P.L. Female, caucasian 79 yo

RE-DUAL PCI

Study in NVAF patients undergoing PCI

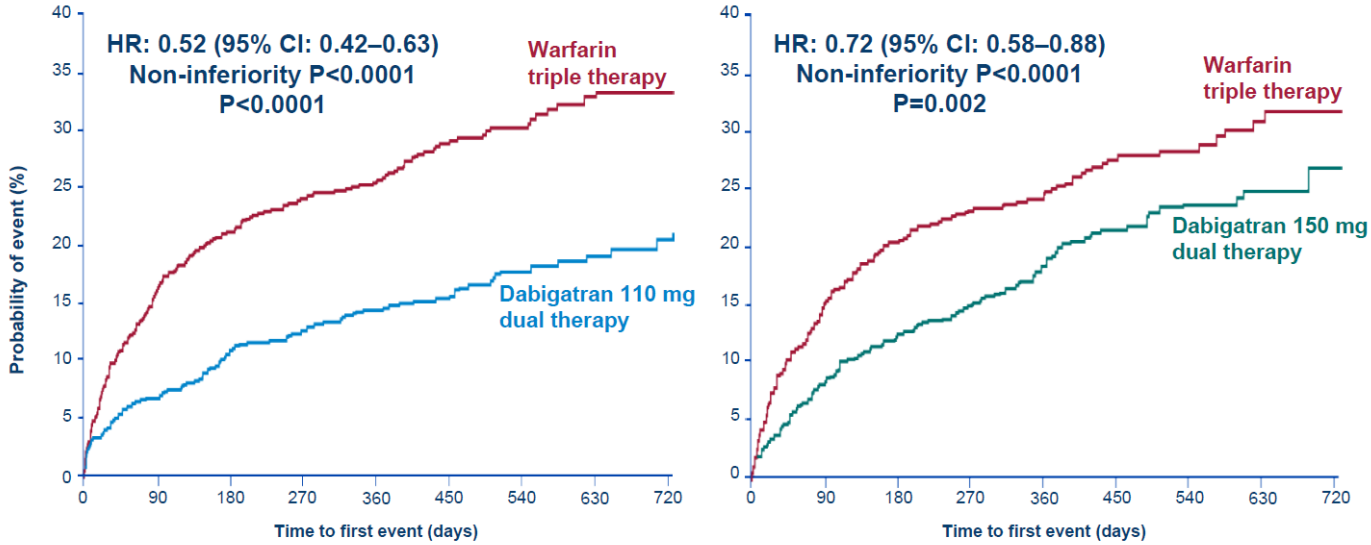
Primary Endpoint: Time to first ISTH major or clinically relevant non-major bleeding event

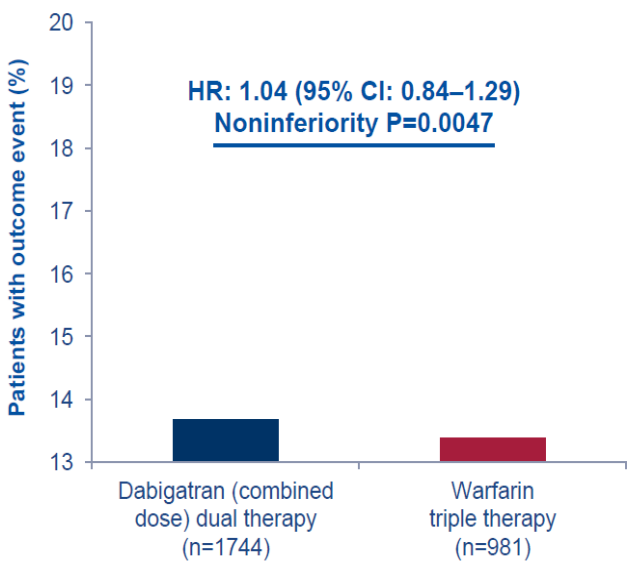


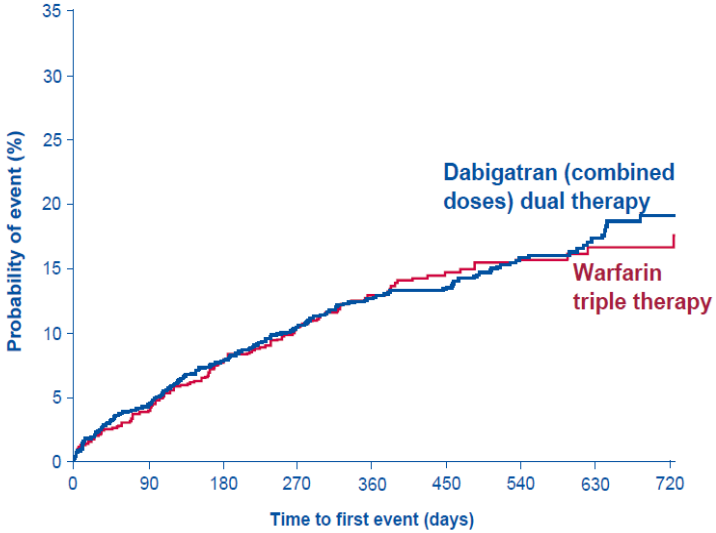
Full analysis set presented. HRs and Wald CIs from Cox proportional-hazard model. For the dabigatran 110 mg vs warfarin comparison, the model is stratified by age, non-elderly vs elderly (<70 or ≥70 in Japan and <80 or ≥80 years old elsewhere). For the dabigatran 150 mg vs warfarin comparison, an unstratified model is used, elderly patients outside the USA are excluded. Non-inferiority P value is one sided (alpha=0.025). Wald two-sided P value from (stratified) Cox proportional-hazard model (alpha=0.05)

RE-DUAL PCI

Study in NVAF patients undergoing PCI

Dabigatran dual-therapy was non-inferior to warfarin triple therapy in the composite efficacy endpoint





Noninferiority P-value is one sided (alpha=0.025). Results presented are Step 3 of hierarchical testing procedure testing noninferiority of dabigatran dual therapy (combined doses) to warfarin triple therapy in death or thromboembolic event and unplanned revascularisation. Cannon et al. ESC 2017

RE-DUAL PCI

Study in NVAF patients undergoing PCI

March 2014

The dual primary endpoints for this trial are a composite endpoint of efficacy and a safety endpoint:

1. Time to death or first thrombotic event (DTE) (all death, MI, stroke/SE)
2. Time to first ISTH Major Bleeding Event (MBE)

The secondary endpoints of efficacy are (all time to event endpoints):

1. Individual outcome events:
   - All death
     - Cardiovascular death
     - Non-cardiovascular death
     - Undetermined
   - MI
   - Stroke
   - SE
   - Stent thrombosis
2. Composite endpoint of death + MI + stroke
3. Repeated revascularisation by PCI/CABG

2840 patients in each treatment group (i.e. 8520 randomised patients in total).

July 2016 (after 3 global amendments)

The primary endpoint for this trial is a safety endpoint. See section 5.2.1. There are no primary efficacy endpoints.

The secondary efficacy endpoints (all time to first event) are:

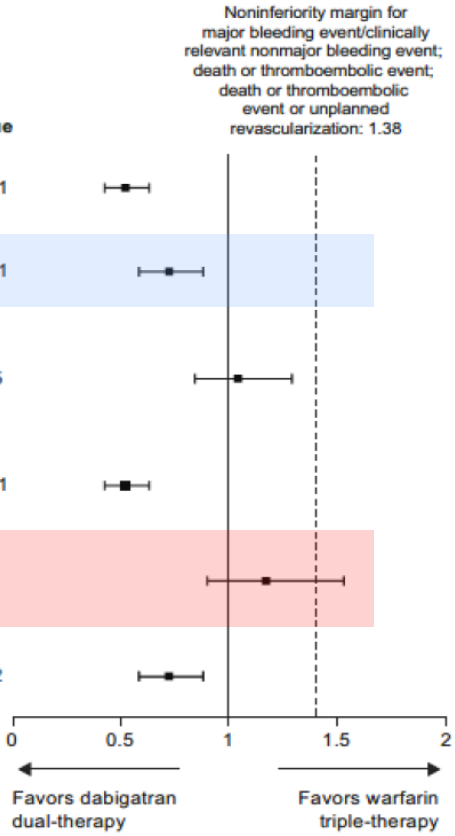
1. A combined endpoint of thrombotic events or death (DTE: all death + MI + stroke/SE) and unplanned revascularisation by PCI/CABG
2. A combined endpoint of thrombotic events or death (DTE: all death + MI + stroke/SE)
3. Individual outcome events:
   - All death
     - Cardiovascular death
     - Non-cardiovascular death
     - Undetermined
   - MI
   - Stroke
   - SE
   - Stent thrombosis
4. Composite endpoint of death + MI + stroke
5. Unplanned revascularisation by PCI/CABG

834 patients in each treatment group (i.e. 2502 randomised patients in total)

RE-DUAL PCI

Study in NVAF patients undergoing PCI

Step	Test	HR (95% CI)	P-value
1	Noninferiority of dabigatran 110 dual-therapy to warfarin triple-therapy in major bleeding event/ clinically relevant nonmajor bleeding event	0.52 (0.42 to 0.63)	<0.001
2	Noninferiority of dabigatran 150 dual-therapy to warfarin triple-therapy* in major bleeding event/ clinically relevant nonmajor bleeding event	0.72 (0.58 to 0.88)	<0.001
3	Noninferiority of dabigatran 150 dual-therapy and dabigatran 110 dual-therapy combined to warfarin triple-therapy in death or thromboembolic event or unplanned revascularization by PCI/CABG	1.04 (0.84 to 1.29)	0.005
4	Superiority of dabigatran 110 dual-therapy to warfarin triple-therapy in major bleeding event/ clinically relevant nonmajor bleeding event	0.52 (0.42 to 0.63)	<0.001
5	Noninferiority of dabigatran 150 dual-therapy and dabigatran 110 dual-therapy combined to warfarin triple-therapy in death or thromboembolic event	1.17 (0.90 to 1.53)	0.11
6	Superiority of dabigatran 150 dual-therapy to warfarin triple-therapy* for major bleeding event/ clinically relevant nonmajor bleeding event	0.72 (0.58 to 0.88)	0.002



Dropping aspirin in patients with atrial fibrillation undergoing percutaneous coronary intervention: a jump with a weak parachute?

Augustus

Prospective, multicenter, two-by-two factorial, randomized clinical trial

INCLUSION
- Atrial fibrillation (prior, persistent, >6 hr)
  - Physician decision for OAC
- Acute coronary syndrome or PCI
  - Planned $P2Y_{12}$ inhibitor for ≥6 months

Randomize
n=4600 patients

EXCLUSION
- Contraindication to DAPT
- Other reason for VKA (prosthetic valve, moderate / severe mitral stenosis)

Apixaban 5 mg BID
Apixaban 2.5 mg BID in selected patients

Open Label

VKA
(INR 2–3)

Aspirin for all on the day of ACS or PCI and before randomization

Aspirin — *Double Blind* — **Placebo**

Aspirin — *Double Blind* — **Placebo**

Primary outcome: ISTH major / CRNM bleeding
Secondary outcome(s): death / hospitalization, death / ischemic events

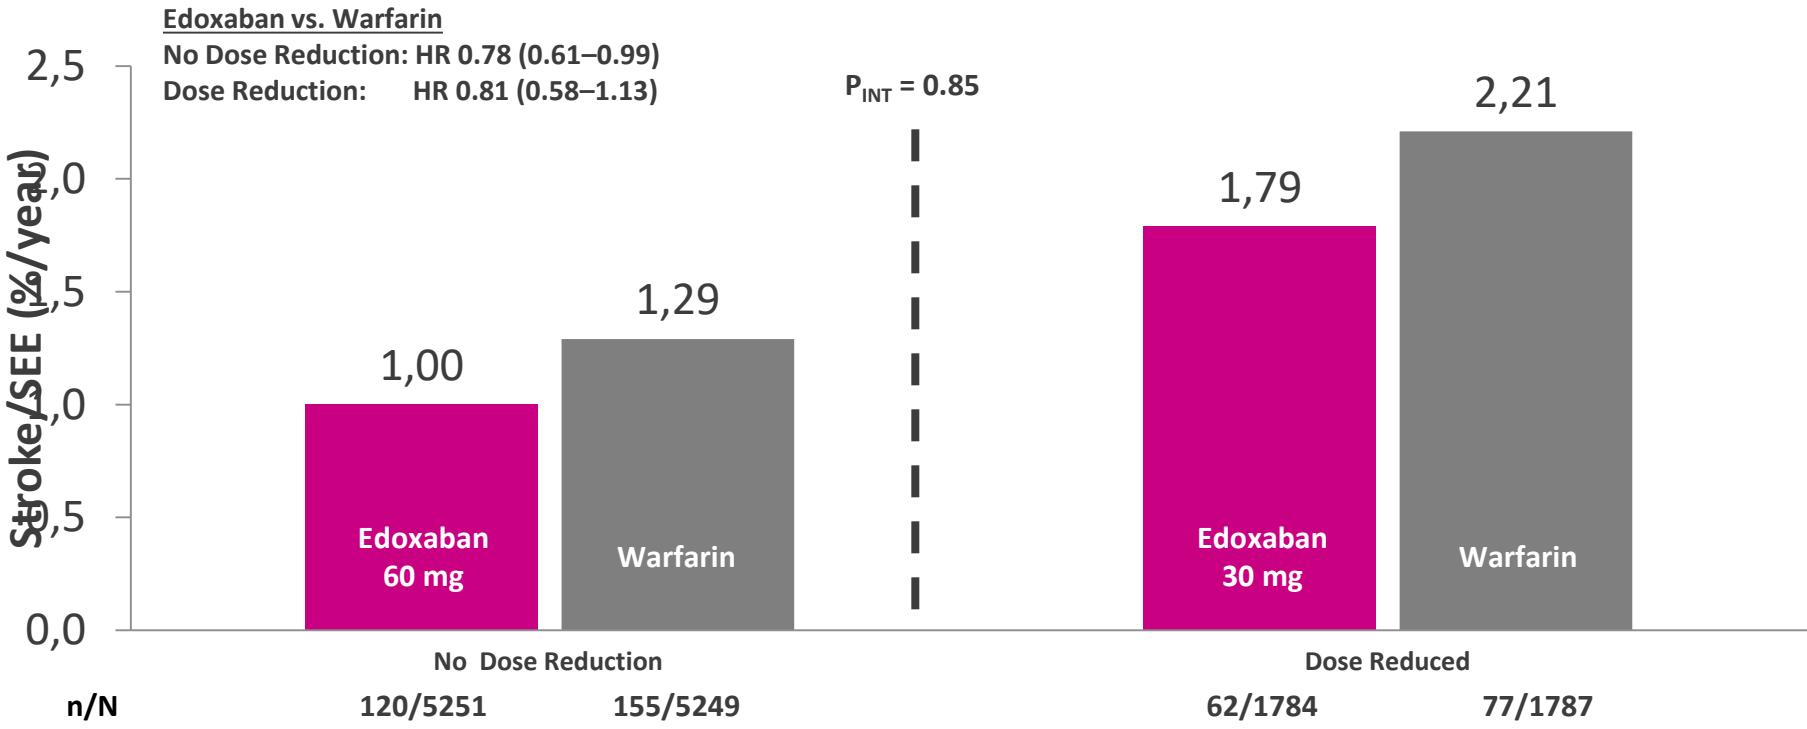
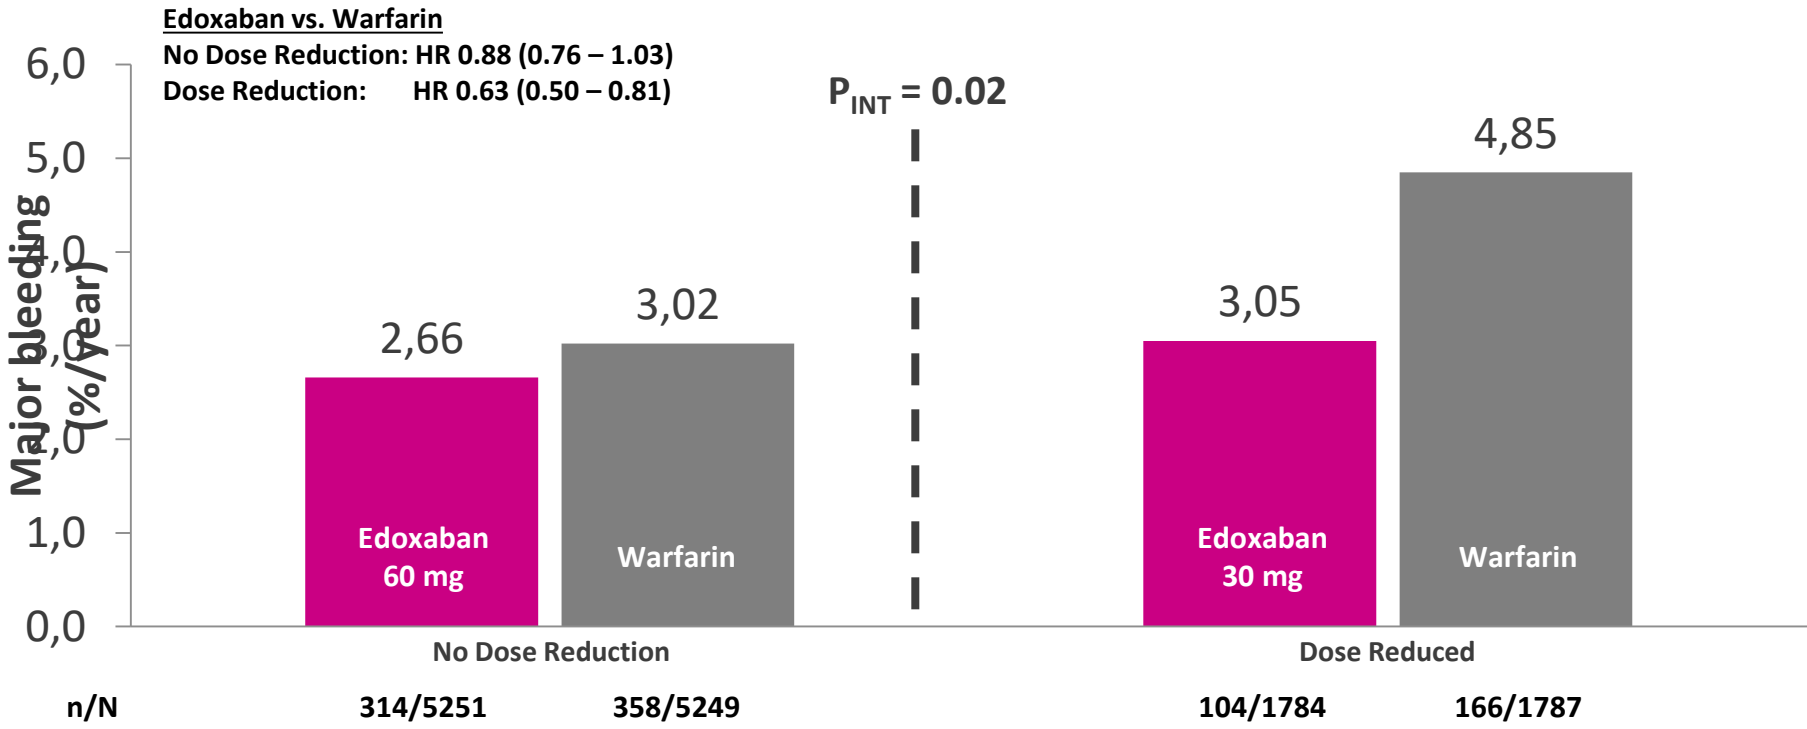
Efficacy is maintained with dose reduction



Ruff et al. Lancet. 2015;385:2288–95

Dose reduction enhances safety relative to warfarin



Ruff et al. Lancet. 2015;385:2288–95

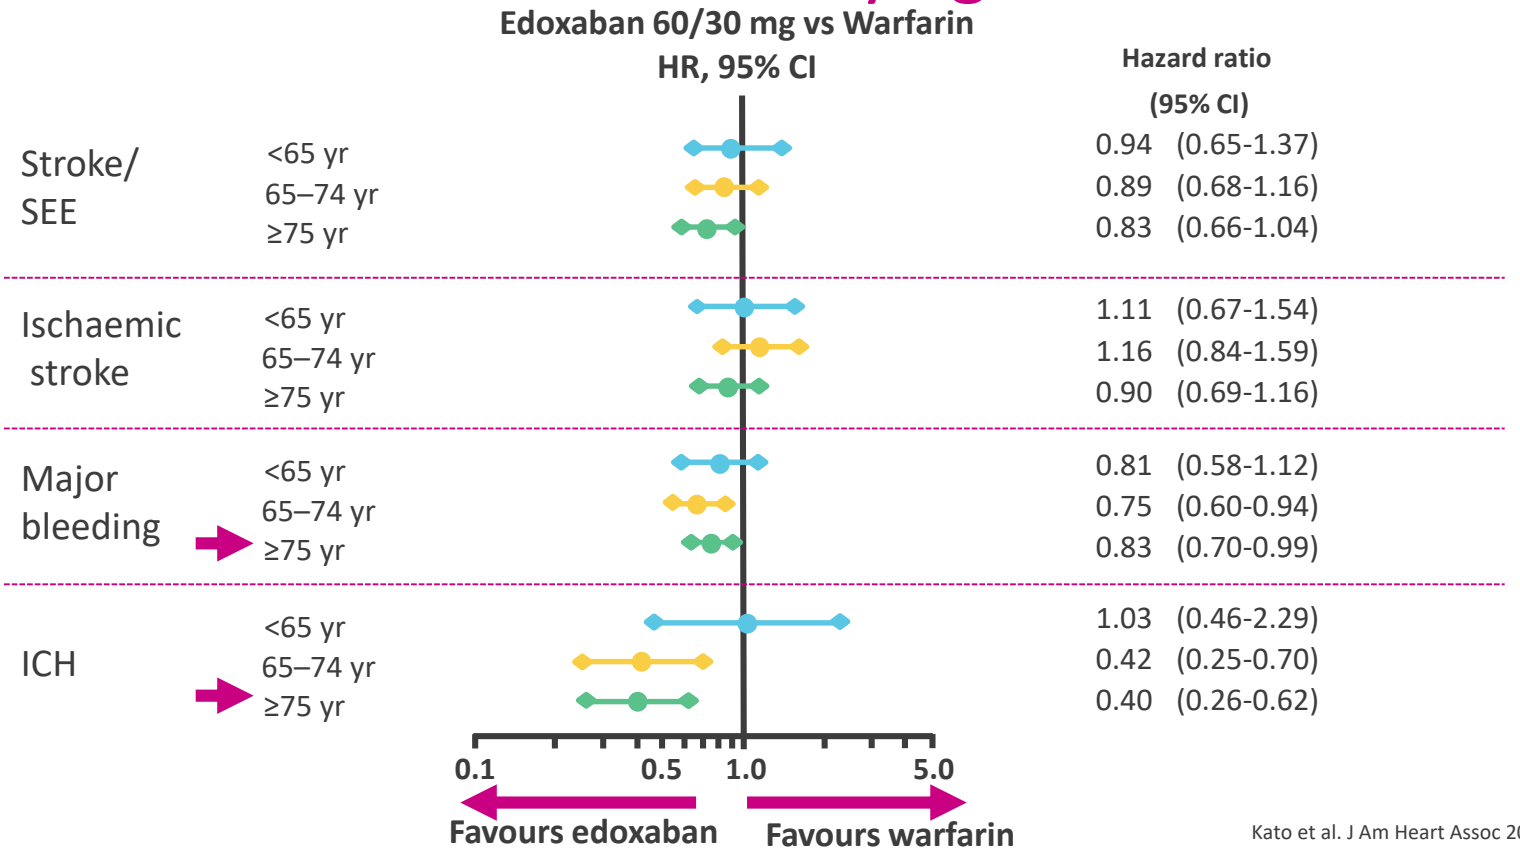
Elderly patients in ENGAGE AF-TIMI 48

- In a pre-specified analysis of elderly patients from ENGAGE AF-TIMI 48 patients were stratified into three age categories:
  - <65 years (26%, n=5,497)
  - 65–74 years (34%, n=7,134)
  - ≥75 years (40%, n=8,474)

	<65 years	65–74 years	≥75 years
Median age, years (interquartile)	59 (55–62)	70 (67–72)	79 (76–82)
Prior stroke or TIA , N (%)	1520 (28)	2334 (33)	2119 (25)
CHA_2DS_2-VASc score, mean (SD)	3.2 (1.1)	4.4 (1.1)	5.0 (1.3)
CHA_2DS_2-VASc score 4–9, N (%)	1815 (33)	5626 (79)	7478 (88)
HAS-BLED score ≥3, N (%)	894 (16)	4129 (58)	4779 (56)
Dose reduced at randomisation, N (%)	571 (10)	1297 (18)	3488 (41)

Kato et al. J Am Heart Assoc 2016;5:e003432

Efficacy and safety of edoxaban vs warfarin by age



Kato et al. J Am Heart Assoc 2016;5:e003432

P.L. Female, caucasian 76 yo

- Sinus Rhythm + Paroxysmal Atrial Fibrillation
- CHA_2DS_2-VASc → 7
- HAS BLED → 4

Edoxaban 30 mg + clopidogrel (after 1 month of aspirin)

Conclusions

DAT (with DOACs) as compared to TAT (with DOACs) confers a significant reduction of major bleeding rates. Overall ischaemic events do not differ significantly, except for the risk of stent thrombosis that is increased significantly (by 60% in our metanalysis) with DAT.

This should be taken into account in very complex PCIs in fragile patients, as the patients included in the DAT vs. TAT trials were “good” patients.

Choice among DOACS for fragile patients is difficult: edoxaban (OD, reduced dose can be often given, equally effective-less bleeding, good for frail patients at risk of falls) and apixaban (after AUGUSTUS, especially without aspirin in DAT) can be good choices.

Think about LAA closure!!!
